1. Introduction

This document provides a high-level overview of the changes introduced in BIRD Data Model version 6.7, published in March 2026, compared with version 6.6. These updates were primarily driven by the quality review of the BIRD Logical Data Model (LDM) conducted within the framework of the BIRD Operational Task Project (BOT¹). In addition, further refinements were implemented to address identified model inconsistencies.

The changes are documented in 17 GitLab issues and resulted in the creation of 54 new entity types and the modification of 612 existing ones, across a total of 173 commits.

The document also presents a high-level overview of the updates to the BIRD Transformation Rules leading to version 3.1, published in March 2026. These updates include revised versions of the AnaCredit, FINREP, and Asset Encumbrance rules, reflecting the changes introduced in the BIRD Data Model.

2. Summary of the most impactful changes to the BIRD Data Models

Below is a summary of the changes to the LDM that were discussed and approved by the Work Stream on Data Modelling (WS DM), with a primary focus on enhancing the overall quality of the model.

A comprehensive list of changes — including the relevant GitLab issues from the issue tracking system and the complete set of corresponding log messages from the source control system (git) — is available to BIRD members within the GitLab environment².

2.1 Updates due to the LDM Content Quality Review (BOT)

- Gold has been introduced as a type of `non-financial asset` in order to explicitly identify gold that is recognised on the balance sheet.
- FINREP and Asset Encumbrance reporting schemes have been added as new attributes to the `Reporting agent internal group role` entity type.
- The link between `Collateral given` and `OTC derivatives` and `Deposits` has been established through the `Deposit Collateral given assignment` and the `Over-the-`

¹ The project, approved by the ECB's Governing Council, aims to enhance the BIRD initiative, supporting European banks in the production of high-quality regulatory reports. Currently in its implementation phase, the updates described in BIRD are aligned with the quality improvements envisioned as part of the project. For more information regarding the BOT project, please refer to BIRD Newsletter nr. 5 – October 2025.

² Please read the Release Notes.md for the full set of changes in our GitLab environment.

counter (OTC) Derivative instrument Collateral given assignment. The entity type Loan and advance Collateral given assignment has been removed.

- Derived attributes without associated derivation rules have been moved to input (non-derived) entity types.
- The modelling structure of Security position has been revised to explicitly represent balance sheet recognition through the introduction of the new entity type Balance sheet recognised/Non-balance sheet recognised security position and its related subtypes. Moreover, the new structure allows the same balance sheet recognised security position to be both long and short within the same reference period, through the introduction of Long/Short balance sheet recognised security position further subtyped in Long balance sheet recognised security position and Short balance sheet recognised security position subtypes.
- The modelling structure for Repurchase agreements has been revised to remove inconsistencies and duplications. The repurchase transaction is now directly linked to gold or gold collateral (depending on whether it is a repo or reverse repo) via dedicated assignment entity types: Repurchase transaction gold (given) assignment and (Reverse) repurchase transaction gold collateral received assignment. Similarly, long security positions are linked to the repurchase transaction through specific assignments, such as (Reverse) Repurchase transaction Non-balance sheet recognised security position (received), Repurchase transaction Long balance sheet recognised security position (given) assignment and Repurchase transaction Non-balance sheet recognised security position (given) assignment covering reused positions in repurchase transactions.
- The High liquidity and credit quality (HQLA) indicator has been renamed in (Extremely) High liquidity and credit quality (HQLA) indicator to align with Asset Encumbrance requirements.
- Institutional sector has been repositioned lower in the hierarchy to ensure the consistent application of constraints depending on the party type (e.g. Institutional sectors applicable to Credit institutions are only credit institutions excluding entities under Article 2(5) of Directive 2013/36/EU versus credit institutions falling under Article 2(5) of Directive 2013/36/EU).

2.2 Other Updates

- A new subtype reflecting renegotiation status and the application of forbearance measures has been introduced for Credit facility and Debt security, aligning their treatment with that already applied to Financial asset instrument.
- The attribute Asset encumbrance residual maturity band has been renamed Liability encumbrance residual maturity band to better reflect its scope and intended use.

3. Changes to the Forward Engineering

A minor change has been introduced in the forward engineering process. In the Entity role (ENTTY_RL) table, only the column Entity role type (ENTTY_RL_TYP) has been retained. This column now incorporates the main hierarchy that was previously contained in the Party role type (PRTY_RL_TYP) column. The columns Entity group role type (ENTTY_GRP_RL_TYP) and Entity transaction role type (ENTTY_TRNSCTN_RL_TYP) have been removed.

4. Summary of most impactful changes to the BIRD Transformation Rules

Below is a summary of the changes implemented in version 3.0 of the BIRD Transformation Rules.

Changes affecting AnaCredit

The Source of Encumbrance derivation rule has been revised to reflect the changes in the modelling structure of repurchase agreements, as described in paragraph 2.1. The generation rules have been updated to reflect the overall changes to the BIRD Data Model.

Changes affecting FINREP/Asset Encumbrance

The Transformation Rules of FINREP and Asset Encumbrance have been updated to align with the changes to the BIRD Data Model.
